SQL - Alias Syntan

Rename a table or a column temporarily by giving another name known as Alias

The use of table alias is to rename a table in a specific SQL statement. The renaming is a temporary change and actual table

name does not change in the database.

The column aliases are used to rename a table's column for the purpose of a particular SQL query.

Syntan:

SELECT column 1, column 2

FROM table_name as alias_name

WHERE [condition]

SQL - Unions Clause

* The SQL UNION clause/operator is used to combine the results of two or more SELECT statements without returning duplicate rows;

* To use this UNION clause, each SELECT statement must have

- * The same number of column selected
- * The same number of column expressions
- * The same data type
- * Have them in same order

(Syntax :

SELECT column1 [, column2]

FROM table1 [, table2]

[WHERE condition]
